## **Green Energy**

Our company deals with the administration and commercial operation of solar photovoltaic and wind parks. The resulting electricity is a product quantified in MW produced.

Photovoltaic and wind parks do not constantly produce electricity, so certain observations are required based on several factors, among which we offer services for issuing daily production forecasts, ANRE Reports, Tranelectrica Reports, Management and Marketing of green certificates. The fluctuating amount of electricity reaches the zonal distributor through the Tranelectrica transporter, the operator that divides your electricity production into several points.

Through an authority component of our company that gathers information regarding the production and association of consumption, in order to establish statistics and further regulations so as to further support the production of green energy. So the part responsible for balancing (PRE) plays an important role in the commercial operation of your solar and wind park. Basically, we take care of the flow of transmission of your electricity production to the market.

The contracts that regulate these aspects will be concluded with the zonal and PRE authorized distributor chosen by you, and their maintenance and development is in our care, having the advantage of outsourcing commercial operation services

Services offered by our company:

- Daily production schedule.
- ANRE and Tranelectrica reports.
- Notifications to the Balancing Party (PRE).
- Management and Marketing of green certified electricity.
- Monitoring the correct operation of the production unit
